## OUR FEET

Our feet are the base which supports our whole body. For this reason they are subject to all kinds of pressure and wear, which act in a negative way on the normal function of the feet. Any problem with our feet reflects on the rest of our body.

We walk mainly on hard unforgiving surfaces like concrete or wooden and tiled floors. This can cause all sorts of problems such as aches and pains in our feet, ankles, knees, hips and back.

What we wear on our feet is a very important part of foot care. Improperly fitting shoes cause or aggravate a lot of foot problems and wearing unsuitable shoes for our occupation also add to discomfort, pain and tired heavy legs at the end of the working day. Lots of people who have problems with their feet realise too late that they should have taken better care of them.

## GETTING THE RIGHT FOOTWEAR

During a lifetime, your feet may walk the equivalent of four times around the world, so it is essential that you take good care of them.

Properly fitted supportive shoes can help relieve many aches and pains by putting the feet in a natural position for standing and walking. If you suffer from back, knee, ankle or heel pain, getting the right footwear can help remedy your condition.

People whose jobs require them to be on their feet for a significant part of the day need comfortable, supportive shoes.

People with particular medical conditions, including diabetes, arthritis, bunions, plantar fasciitis or edema, can also benefit from having the right footwear.
